

opal seal

Patient treated with Opal Seal prior to bracket placement. Poor oral hygiene during treatment resulted in plaque buildup, bleeding gums, and other oral health issues. The lower centrals had the most severe plaque buildup.

Brackets were removed, and his teeth were cleaned with prophylaxis paste. Pay special attention to the enamel on the lower centrals where plaque buildup was worst.

Sealing teeth can help **avoid** difficult conversations regarding white spots.

An example of decalcification resulting from improper oral hygiene during orthodontic treatment.

An example of healthy enamel after orthodontic treatment with Opal Seal.

Minimal wear of Opal Seal over the span of 19 months with no reapplication
